

AADITYA JAIN

Full-Stack · Agentic AI · Backend Engineering

Delhi, India | +91 93066 60207 | jainaadi333@gmail.com | [LinkedIn](#) | [GitHub](#) | [Portfolio](#)

SUMMARY

Full-stack engineer who ships complete product surfaces - Go and TypeScript services, Angular and React interfaces - and production AI agent workflows built to survive failure. 500+ DSA problems solved, and a year spent teaching them.

TECHNICAL SKILLS

Languages: Go, TypeScript, JavaScript, Python, C++, SQL

Backend & Infrastructure: Go concurrency, FastAPI, Express.js, Django, REST API design, MongoDB, Azure Functions, serverless, Docker, Git, Linux, TCP/UDP, caching

Frontend & UI: Angular, React, SvelteKit, Tailwind CSS, component architecture, responsive and accessible UI

AI & Agentic Systems: LLM orchestration, Activepieces and Make.com workflow automation, human-in-the-loop approval design, structured-output pipelines, Model Context Protocol (MCP), retry and fallback design

Core CS: Data Structures & Algorithms, Systems Design, Distributed Systems fundamentals

EXPERIENCE

Gravity - AI Agent Builder Intern | *Activepieces, LLM orchestration, Slack API, GitHub API* | Aug 2026 - Present

- Own production, customer-facing agentic workflows in **Activepieces**, built around explicit failure paths: retries with backoff, idempotent reruns on duplicate triggers, and defined degradation when model output is unusable.
- Shipped an automated **release builder** - one release trigger drafts both the internal engineering changelog and the external customer-facing release note from merged PRs and their metadata.
- Added a **human-in-the-loop Slack approval gate**: a reviewer accepts or declines a draft in-channel, and a decline returns their reasoning to the model as a revision signal, so the next draft is corrected rather than regenerated blind.
- Removed duplicate release entries by reconciling multiple PRs into one canonical change per feature, and conditioned drafts on prior releases so tone, structure, and detail match the established voice.
- Ranked **first among internal agent builders** on workflow quality.

Sage Learning - Full-Stack Developer Intern | *Angular, Azure Functions, TypeScript, Make.com* | Aug 2026 - Present

- Building an internal notification system end to end - event-driven delivery on **Azure Functions** with an **Angular** interface for preferences and history, kept off the main application's request path.
- Improved the backend behind internal tools - tighter API endpoints and data handling - and replaced a manual recurring-reporting routine with a scheduled **Make.com** pipeline.
- Redesigned the company website around clear visual hierarchy, consistent spacing, and stronger contrast, restructuring the landing flow so the product's value proposition reads in the first screen.

PROJECTS

GetPlaced - Agentic Job-Search Automation Engine | *LLM orchestration, MCP, Python, modular pipeline architecture* [\[Repo\]](#)

- Built an end-to-end agentic pipeline - candidate profiling, job discovery across 3 APIs behind one normalized interface, AI ranking, and application prep - compressing a manual 3-hour weekly search into under 10 minutes, entirely on-device.
- Engineered a selection layer pairing structured LLM analysis with deterministic fallback scoring, holding 100% run completion through provider outages, rate limits, and malformed model responses.

Native HTTP/1.1 Server - Built from Scratch in Go | *Go, raw TCP sockets, RFC 2616, goroutine concurrency* [\[Repo\]](#)

- Implemented a protocol-compliant HTTP/1.1 server directly on raw TCP sockets with zero use of net/http or frameworks, parsing byte streams through a hand-written state-machine request parser.
- Served concurrent clients with goroutine-per-connection handling, verified race-free under Go's -race detector with no goroutine or memory leaks across sustained load.

Competitive-Programming Data Aggregator | *Node.js, Express, MongoDB, schema normalization* [\[Repo\]](#)

- Unified LeetCode, GeeksforGeeks, and Codeforces statistics behind one canonical schema and REST API, including a scraper for GFG submission data; now the data layer for a downstream ranking project.

ACHIEVEMENTS & LEADERSHIP

- **Codeforces Pupil** - peak rating 1306 (PlayerCodes); 500+ DSA problems solved across LeetCode and other platforms.
- **2nd Place, Codenheimer Season 2** - college-level contest in reverse engineering, debugging, and pattern recognition.
- **DSA Instructor, Hash Define** - taught bit manipulation, recursion, DP, and graphs to 10+ juniors over 1+ year.

EDUCATION

B.Tech, Information Technology | Bhagwan Parshuram Institute of Technology (BPIT), Delhi | 2024–2028 | **CGPA 9.3 / 10**
